

CLOUD MONITORING & REPORTING SYSTEM

Colmac offers a high-performance, fully featured cloud-based monitoring and reporting interface for Colmac WaterHeat Units. Seamlessly connect individual units or entire arrays securely to the cloud, allowing building supervisor and owners the ability to monitor performance and be alerted to abnormalities or even custom-triggered events through any internet connection. Alerts can be sent via email or by SMS text message.* This module also allows for factory access for troubleshooting and tuning performance.

Cloud enabled devices allow registered users to view data via user-configurable dashboard, download historical data and provide remote monitor and remote control for any connected device. There are no recurring fees for this service, and the cloud retains the last year of data on its servers.

*Text Messaging may incur additional fees from the customer service provider depending on plan specifics.
